Package: PanelMatch (via r-universe)

September 9, 2024

Type Package

Title Matching Methods for Causal Inference with Time-Series Cross-Sectional Data

Version 1.0.1

Date 2020-02-10

Description Implements a set of methodological tools that enable researchers to apply matching methods to time-series cross-sectional data. Imai, Kim, and Wang (2018) <http://web.mit.edu/insong/www/pdf/tscs.pdf> proposes a nonparametric generalization of the difference-in-differences estimator, which does not rely on the linearity assumption as often done in practice. Researchers first select a method of matching each treated observation for a given unit in a particular time period with control observations from other units in the same time period that have a similar treatment and covariate history. These methods include standard matching methods based on propensity score and Mahalanobis distance, as well as weighting methods. Once matching is done, both short-term and long-term average treatment effects for the treated can be estimated with standard errors. The package also offers a visualization technique that allows researchers to assess the quality of matches by examining the resulting covariate balance.

`PanelMatch-package` *Matching Methods for Causal Inference with Time-Series Cross-Sectional Data*

Description

Implements a set of methodological tools that enable researchers to apply matching methods to time-series cross-sectional data. Imai, Kim, and Wang (2018) proposes a nonparametric generalization of the difference-in-differences estimator, which does not rely on the linearity assumption as often done in practice. Researchers first select a method of matching each treated observation for a given unit in a particular time period with control observations from other units in the same time period that have a similar treatment and covariate history. These methods include standard matching methods based on propensity score and Mahalanobis distance, as well as weighting methods. Once matching is done, both short-term and long-term average treatment effects for the treated can be estimated with standard errors. The package also offers a visualization technique that allows researchers to assess the quality of matches by examining the resulting covariate balance.

Details

Package:	PanelMatch
Type:	Package
Version:	0.0.1-
Date:	2018-03-01
License:	GPL (>= 3)

Maintainer: In Song Kim <insong@mit.edu>

References

Imai, Kosuke, In Song Kim and Erik Wang. (2018)

`balance_scatter` *balance_scatter*

Description

Visualizing the standardized mean differences for covariates via a scatter plot.

Usage

```
balance_scatter(
  non_refined_set,
  refined_list,
  xlim = c(0, 0.8),
  ylim = c(0, 0.8),
  main = "Standardized Mean Difference of Covariates",
  pchs = c(2, 3),
  covariates,
  data,
  x.axis.label = "Before refinement",
  y.axis.label = "After refinement",
  ...
)
```

Arguments

non_refined_set	a matched.set object produced by setting ‘refinement.method‘ to "none" in ‘PanelMatch‘
refined_list	a list of one or two matched.set objects
xlim	xlim of the scatter plot. This is the same as the xlim argument in plot
ylim	ylim of the scatter plot. This is the same as the ylim argument in plot
main	title of the scatter plot. This is the same as the main argument in plot
pchs	one or two pch indicators for the symbols on the scatter plot. See plot for more information
covariates	variables for which balance is displayed
data	the same time series cross sectional data set used to create the matched sets.
x.axis.label	x axis label
y.axis.label	y axis label
...	optional arguments to be passed to plot

Details

balance_scatter visualizes the standardized mean differences for each covariate. Although users can use the scatter plot in a variety of ways, it is recommended that the x-axis refers to balance for covariates before refinement, and y-axis refers to balance after refinement. Users can utilize parameters powered by plot in base R to further customize the figure.

Examples

```
# get a matched set without refinement
sets0 <- PanelMatch(lag = 4, time.id = "year", unit.id = "wbcode2",
                    treatment = "dem", refinement.method = "none",
                    data = dem, match.missing = FALSE,
                    covs.formula = ~ I(lag(y, 1:4)) + I(lag(tradewb, 1:4)),
                    size.match = 5, qoi = "att",
                    outcome.var = "y",
                    lead = 0:4, forbid.treatment.reversal = FALSE)

# get a matched set with refinement using CBPS.match, setting the
# size of matched set to 5
sets1 <- PanelMatch(lag = 4, time.id = "year", unit.id = "wbcode2",
                    treatment = "dem", refinement.method = "mahalanobis",
                    data = dem, match.missing = FALSE,
                    covs.formula = ~ I(lag(y, 1:4)) + I(lag(tradewb, 1:4)),
                    size.match = 5, qoi = "att",
                    outcome.var = "y",
```

```
                    lead = 0:4, forbid.treatment.reversal = FALSE)

# get another matched set with refinement using CBPS.weight
sets2 <- PanelMatch(lag = 4, time.id = "year", unit.id = "wbcode2",
                    treatment = "dem", refinement.method = "ps.weight",
                    data = dem, match.missing = FALSE,
                    covs.formula = ~ I(lag(y, 1:4)) + I(lag(tradewb, 1:4)),
                    size.match = 10, qoi = "att",
                    outcome.var = "y",
                    lead = 0:4, forbid.treatment.reversal = FALSE)

# use the function to produce the scatter plot
balance_scatter(non_refined_set = sets0$att,
              refined_list = list(sets1$att, sets2$att),
              data = dem,
              covariates = c("y", "tradewb"))
# add legend
legend(x = 0, y = 0.8,
legend = c("mahalanobis",
           "PS weighting"),
y.intersp = 0.65,
x.intersp = 0.3,
xjust = 0,
pch = c(1, 3), pt.cex = 1,
bty = "n", ncol = 1, cex = 1, bg = "white")
```

---

dem *County-level Democracy indicator*

Description

A dataset containing the democracy indicator for 184 countries from 1960 to 2010

Format

A dataframe containing 9384 rows and 3 variables

Details

- wbcode2. World Bank country ID
- year. year (1960–2010)
- dem. binary indicator of democracy as defined in Acemoglu et al.
- y log of GDP per capita in 2000 constant dollars (multiplied by 100)
- tradewb Exports plus Imports as a share of GDP from World Bank

Source

Acemoglu, Daron, Suresh Naidu, Pascual Restrepo, and James A Robinson. "Democracy does cause growth." Journal of Political Economy.

`DisplayTreatment` *DisplayTreatment*

Description

`DisplayTreatment` visualizes the treatment distribution across units and time in a panel dataset

Usage

```
DisplayTreatment(
  unit.id,
  time.id,
  treatment,
  data,
  color.of.treated = "red",
  color.of.untreated = "blue",
  title = "Treatment Distribution \n Across Units and Time",
  xlab = "Time",
  ylab = "Unit",
  x.size = 10,
  y.size = 5,
  legend.position = "none",
  x.angle = 45,
  y.angle = NULL,
  legend.labels = c("not treated", "treated"),
  decreasing = FALSE,
  matched.set = NULL,
  show.set.only = FALSE,
  hide.x.axis.label = FALSE,
  hide.y.axis.label = FALSE,
  gradient.weights = FALSE,
  dense.plot = FALSE
)
```

Arguments

`unit.id`	Name of the unit identifier variable as a character string
`time.id`	Name of the time identifier variable as a character string
`treatment`	Name of the treatment variable as a character string
`data`	data.frame that contains the time series cross sectional data used for matching and estimation. Unit and time data must be integers. Time data must also be formatted as sequential integers that increase by one.

`color.of.treated`
: Color of the treated observations provided as a character string (this includes hex values). Default is red.

`color.of.untreated`
: Color of the untreated observations provided as a character string (this includes hex values). Default is blue.

`title`
: Title of the plot provided as character string

`xlab`
: Character label of the x-axis

`ylab`
: Character label of the y-axis

`x.size`
: Numeric size of the text for xlab or x axis label. Default is 10. Assign x.size = NULL to use built in ggplot2 method of determining label size. When the length of the time period is long, consider setting to NULL and adjusting size and ratio of the plot.

`y.size`
: Numeric size of the text for ylab or y axis label. Default is 5. Assign y.size = NULL to use built in ggplot2 method of determining label size. When the number of units is large, consider setting to NULL and adjusting size and ratio of the plot.

`legend.position`
: Position of the legend. Provide this according to ggplot2 standards.

`x.angle`
: Angle (in degrees) of the tick labels for x-axis

`y.angle`
: Angle (in degrees) of the tick labels for y-axis

`legend.labels`
: Character vector of length two describing the labels of the legend to be shown in the plot. ggplot2 standards are used.

`decreasing`
: Logical. Determines if display order should be increasing or decreasing by the amount of treatment received. Default is `decreasing` = FALSE.

`matched.set`
: a matched.set object (optional) containing a single treated unit and a set of matched controls. If provided, this set will be highlighted on the resulting plot.

`show.set.only`
: logical. If TRUE, only the treated unit and control units contained in the provided `matched.set` object will be shown on the plot. Default is FALSE. If no `matched.set` is provided, then this argument will have no effect.

`hide.x.axis.label`
: logical. If TRUE, x axis labels are not shown. Default is FALSE.

`hide.y.axis.label`
: logical. If TRUE, y axis labels are not shown. Default is FALSE.

`gradient.weights`
: logical. If TRUE, the "darkness"/shade of units in the provided `matched.set` object will be displayed according to their weight. Control units with higher weights will appear darker on the resulting plot. Control units with lower weights will appear lighter. This argument has no effect unless a `matched.set` is provided.

`dense.plot`
: logical. if TRUE, lines between tiles are removed on resulting plot. This is useful for producing more readable plots in situations where the number of units and/or time periods is very high.

Value

DisplayTreatment returns a treatment variation plot (using ggplot2), which visualizes the variation of treatment across unit and time.

Author(s)

In Song Kim <insong@mit.edu>, Erik Wang <haixiao@Princeton.edu>, Adam Rauh <amrauh@umich.edu>, and Kosuke Imai <imai@harvard.edu>

Examples

```
DisplayTreatment(unit.id = "wbcode2",
                 time.id = "year", legend.position = "none",
                 xlab = "year", ylab = "Country Code",
                 treatment = "dem", data = dem)
```

---

get_covariate_balance *Calculate covariate balance*

Description

Calculate covariate balance for user specified covariates across matched sets. Balance is assessed by taking the average of the difference between the values of the specified covariates for the treated unit(s) and the weighted average of the control units across all matched sets. Results are standardized and are expressed in standard deviations. Balance is calculated for each period in the specified lag window.

Usage

```
get_covariate_balance(
  matched.sets,
  data,
  covariates,
  use.equal.weights = FALSE,
  verbose = TRUE,
  plot = FALSE,
  reference.line = TRUE,
  legend = TRUE,
  ylab = "SD",
  ...
)
```

Arguments

matched.sets	A matched.set object
data	The time series cross sectional data set (as a data.frame object) used to produce the matched.set object. This data set should be identical to the one passed to PanelMatch and PanelEstimate to ensure consistent results.
covariates	a character vector, specifying the names of the covariates for which the user is interested in calculating balance.
use.equal.weights	logical. If set to TRUE, then equal weights will be assigned to control units, rather than using whatever calculated weights have been assigned. This is helpful for assessing the improvement in covariate balance as a result of refining the matched sets.
verbose	logical. When TRUE, the function will return more information about the calculations/results. When FALSE, a more compact version of the results/calculations are returned.
plot	logical. When TRUE, a plot showing the covariate balance calculation results will be shown. When FALSE, no plot is made, but the results of the calculations are returned. default is FALSE
reference.line	logical indicating whether or not a horizontal line should be present on the plot at y = 0. Default is TRUE.
legend	logical indicating whether or not a legend identifying the variables should be included on the plot. Default is TRUE.
ylab	Label for y axis. Default is "SD". This is the same as the ylab argument to plot.
...	Additional graphical parameters to be passed to the plot function in base R.

Examples

```
#add some additional data to data set for demonstration purposes
dem$rdata <- runif(runif(nrow(dem)))
pm.obj <- PanelMatch(lead = 0:3, lag = 4, time.id = "year", unit.id = "wbcode2", treatment = "dem",
                     outcome.var ="y", refinement.method = "mahalanobis",
                     data = dem, match.missing = TRUE,
                   covs.formula = ~ tradewb + rdata + I(lag(tradewb, 1:4)) + I(lag(y, 1:4)),
                     size.match = 5, qoi = "att")
get_covariate_balance(pm.obj$att, dem, covariates = c("tradewb", "rdata"),
                          ylim = c(-2,2))
get_covariate_balance(pm.obj$att, dem, covariates = c("tradewb", "rdata"),
                          plot = TRUE, ylim = c(-2,2))
```

matched_set *matched_set*

Description

matched_set is a constructor for the matched.set class.

Usage

```
matched_set(matchedsets, id, t, L, t.var, id.var, treatment.var)
```

Arguments

matchedsets	a list of treated units and matched control units. Each element in the list should be a vector of control unit ids.
id	A vector containing the ids of treated units
t	A vector containing the times of treatment for treated units.
L	integer specifying the length of the lag window used in matching
t.var	string specifying the time variable
id.var	string specifying the unit id variable
treatment.var	string specifying the treatment variable.
	The constructor function returns a matched.set object. matched.set objects are a modified lists. Each element in the list is a vector of ids corresponding to the control unit ids in a matched set. Additionally, these vectors might have additional attributes – "weights". These correspond to the weights assigned to each control unit, as determined by the specified refinement method. Each element in the list also has a name, which corresponds to the unit id of the treated unit and time of treatment, concatenated together and separated by a period. matched.set objects also have a number of methods defined: summary, plot, and `[`. matched.set objects can be modified manually as long as these conventions (and conventions about other attributes) are maintained. It is important to note that matched.set objects are distinct from PanelMatch objects. matched.set objects are often contained within PanelMatch objects.

Details

Users should never need to use this function by itself. See below for more about matched.set objects.

Value

matched.set objects have additional attributes. These reflect the specified parameters when using the PanelMatch function:

lag	an integer value indicating the length of treatment history to be used for matching. Treated and control units are matched based on whether or not they have exactly matching treatment histories in the lag window.

t.var	time variable name, represented as a character/string
id.var	unit id variable name, represented as a character/string
treatment.var	treatment variable name, represented as a character/string
class	class of the object: should always be "matched.set"
refinement.method	method used to refine and/or weight the control units in each set.
covs.formula	One sided formula indicating which variables should be used for matching and refinement
match.missing	Logical variable indicating whether or not units should be matched on the patterns of missingness in their treatment histories
max.match.size	Maximum size of the matched sets after refinement. This argument only affects results when using a matching method

Author(s)

PanelEstimate *PanelEstimate*

Description

PanelEstimate estimates a causal quantity of interest, including the average treatment effect for treated or control units (att and atc, respectively), or average treatment effect (ate), as specified in PanelMatch. This is done by estimating the counterfactual outcomes for each treated unit using matched sets. Users will provide matched sets that were obtained by the PanelMatch function and obtain point estimates via a weighted average computation with weighted bootstrap standard errors. Point estimates and standard errors will be produced for each period in the lead window specified by the lead argument from PanelMatch. Users may run multiple estimations by providing lists of each argument to the function. However, in this format, every argument must be explicitly specified in each configuration and must adhere to the same data types/structures outlined below. See the included code examples for more about how this functionality works.

Usage

```
PanelEstimate(
  sets,
  number.iterations = 1000,
  df.adjustment = FALSE,
  confidence.level = 0.95,
  moderator = NULL,
  data
)
```

Arguments

sets	A PanelMatch object attained via the PanelMatch function.
number.iterations	An integer value indicating the number of bootstrap iterations. The default is 1000.
df.adjustment	A logical value indicating whether or not a degree-of-freedom adjustment should be performed for the standard error calculation. The default is FALSE.
confidence.level	A numerical value specifying the confidence level and range of interval estimates for statistical inference. The default is .95.
moderator	The name of a moderating variable, provided as a character string. If a moderating variable is provided the returned object will be a list of PanelEstimate objects. The names of the list will reflect the different values of the moderating variable. More specifically, the moderating variable values will be converted to syntactically proper names using make.names.
data	The same time series cross sectional data set provided to the PanelMatch function used to produce the matched sets

Value

PanelEstimate returns a list of class 'PanelEstimate' containing the following components:

estimates	the point estimates of the quantity of interest for the lead periods specified
bootstrapped.estimates	the bootstrapped point estimate values
bootstrap.iterations	the number of iterations used in bootstrapping
method	refinement method used to create the matched sets from which the estimates were calculated
lag	See PanelMatch argument lag for more information.
lead	The lead window sequence for which PanelEstimate is producing point estimates and standard errors.
confidence.level	the confidence level
qoi	the quantity of interest
matched.sets	the refined matched sets used to produce the estimations
standard.error	the standard error(s) of the point estimates

References

Imai, Kosuke, In Song Kim, and Erik Wang (2018)

Examples

```
PM.results <- PanelMatch(lag = 4, time.id = "year", unit.id = "wbcode2",
                         treatment = "dem", refinement.method = "mahalanobis",
                         data = dem, match.missing = TRUE,
                         covs.formula = ~ I(lag(tradewb, 1:4)) + I(lag(y, 1:4)),
                         size.match = 5, qoi = "att",
                        outcome.var = "y", lead = 0:4, forbid.treatment.reversal = TRUE)
PE.results <- PanelEstimate(sets = PM.results, data = dem, number.iterations = 100)
```

PanelMatch *PanelMatch*

Description

Create refined/weighted sets of treated and control units

Usage

```
PanelMatch(
  lag,
  time.id,
  unit.id,
  treatment,
  refinement.method,
  size.match = 10,
  data,
  match.missing = TRUE,
  covs.formula = NULL,
  verbose = FALSE,
  qoi,
  lead = 0,
  outcome.var,
  exact.match.variables = NULL,
  forbid.treatment.reversal = FALSE,
  matching = TRUE,
  listwise.delete = FALSE,
  use.diagonal.variance.matrix = FALSE
)
```

Arguments

lag	An integer value indicating the length of treatment history periods to be matched on
time.id	A character string indicating the name of the time variable in the data. This data currently must be formatted as sequential integers.

`unit.id` A character string indicating the name of unit identifier in the data. This data must be integer.

`treatment` A character string indicating the name of the treatment variable in the `data`. The treatment must be a binary indicator variable (integer with 0 for the control group and 1 for the treatment group).

`refinement.method`
A character string specifying the matching or weighting method to be used for refining the matched sets. The user can choose "mahalanobis", "ps.match", "CBPS.match", "ps.weight", "CBPS.weight", "ps.msm.weight", "CBPS.msm.weight", or "none". The first three methods will use the `size.match` argument to create sets of at most `size.match` closest control units. Choosing "none" will assign equal weights to all control units in each matched set.

`size.match` An integer dictating the number of permitted closest control units in a matched set after refinement. This argument only affects results when using a matching method ("mahalanobis" or any of the refinement methods that end in ".match"). This argument is not needed and will have no impact if included when a weighting method is specified (any `refinement.method` that includes "weight" in the name).

`data` A `data.frame` object containing time series cross sectional data. Time data must be sequential integers that increase by 1. Unit identifiers must be integers. Treatment data must be binary.

`match.missing` Logical variable indicating whether or not units should be matched on the patterns of missingness in their treatment histories. Default is TRUE. When FALSE, neither treated nor control units are allowed to have missing treatment data in the lag window.

`covs.formula` One sided formula object indicating which variables should be used for matching and refinement. Argument is not needed if `refinement.method` is set to "none" If the user wants to include lagged variables, this can be done using a function, "lag()", which takes two, unnamed, positional arguments. The first is the name of the variable which you wish to lag. The second is the lag window, specified as an integer sequence in increasing order. For instance, I(lag(x, 1:4)) will then add new columns to the data for variable "x" for time t-1, t-2, t-3, and t-4 internally and use them for defining/measuring similarity between units. Other transformations using the I() function, such as I(x^2) are also permitted. The variables specified in this formula are used to define the similarity/distances between units.

`verbose` option to include more information about the `matched.set` object calculations, like the distances used to create the refined sets and weights.

`qoi` quantity of interest: `att` (average treatment effect on treated units), `atc` (average treatment effect on control units), `ate` (average treatment effect). Note that the qoi for MSM methods will give the estimated average treatment effect of being treated for a chosen `lead` time periods. This differs slightly from the non-MSM methods, where treatment reversal is permitted.

`lead` integer sequence specifying the lead window, for which qoi point estimates (and standard errors) will ultimately be produced. Default is 0 (which corresponds to contemporaneous treatment effect).

`outcome.var` A character string identifying the outcome variable.

`exact.match.variables`
character vector giving the names of variables to be exactly matched on. These should be time invariant variables. Exact matching for time varying covariates is not currently supported.

`forbid.treatment.reversal`
Logical indicating whether or not it is permissible for treatment to reverse in the specified lead window. This must be set to TRUE for MSM methods. When set to TRUE, only matched sets for treated units where treatment is applied continuously in the lead window are included in the results. Default is FALSE.

`matching` logical indicating whether or not any matching on treatment history should be performed. This is primarily used for diagnostic purposes, and most users will never need to set this to FALSE. Default is TRUE.

`listwise.delete`
TRUE/FALSE indicating whether or not missing data should be handled using listwise deletion or the package's default missing data handling procedures. Default is FALSE.

`use.diagonal.variance.matrix`
TRUE/FALSE indicating whether or not a regular covariance matrix should be used in mahalanobis distance calculations during refinement, or if a diagonal matrix with only covariate variances should be used instead. In many cases, setting this to TRUE can lead to better covariate balance, especially when there is high correlation between variables. Default is FALSE. This argument is only necessary when `refinement.method = mahalanobis` and will have no impact otherwise.

Details

`PanelMatch` identifies a matched set for each treated observation. Specifically, for a given treated unit, the matched set consists of control observations that have an identical treatment history up to a number of `lag` time periods. Researchers must specify `lag`. A further refinement of the matched set may be performed by setting a maximum size of each matched set, `size.match` (the maximum number of control units that can be matched to a treated unit). Users can also specify covariates that should be used to identify similar control units and a method for defining similarity/distance between units. This is done via the `covs.formula` and `refinement.method` arguments, respectively, which are explained in more detail below.

Value

`PanelMatch` returns an object of class "PanelMatch". This is a list that contains a few specific elements: First, a `matched.set` object(s) that has the same name as the provided qoi if the qoi is "att" or "atc". If qoi = "ate" then two `matched.set` objects will be attached, named "att" and "atc." Please consult the documentation for `matched_set` to read more about the structure and usage of `matched.set` objects. Also, see the wiki page for more information about these objects: https://github.com/insongkim/PanelMatch/wiki/Matched-Set-Objects. The `PanelMatch` object also has some additional attributes:

`qoi` The qoi specified in the original function call

`lead` the lead window specified in the original function call

`forbid.treatment.reversal` logial value matching the forbid.treatment.reversal parameter provided in the function call.

`outcome.var` character string matching the outcome variable provided in the original function call.

```

`plot.matched.set` *Plot the distribution of the sizes of matched sets.*

Description

A plot method for creating a histogram of the distribution of the sizes of matched sets. This method accepts all standard optional `hist` arguments via the `...` argument. By default, empty matched sets (treated units that could not be matched with any control units) are noted as a vertical bar at x = 0 and not included in the regular histogram. See the `include.empty.sets` argument for more information about this.

Usage

```
## S3 method for class 'matched.set'
plot(
  x,
  ...,
  border = NA,
  col = "grey",
  ylab = "Frequency of Size",
  xlab = "Matched Set Size",
  lwd = NULL,
  main = "Distribution of Matched Set Sizes",
  freq = TRUE,
  include.empty.sets = FALSE
)
```

Arguments

`x`	a `matched.set` object
`...`	optional arguments to be passed to `hist`
`border`	default is NA. This is the same argument as the standard argument for `hist`
`col`	default is "grey". This is the same argument as the standard argument for `hist`
`ylab`	default is "Frequency of Size". This is the same argument as the standard argument for `hist`
`xlab`	default is "Matched Set Size". This is the same argument as the standard argument for `hist`
`lwd`	default is NULL. This is the same argument as the standard argument for `hist`
`main`	default is "Distribution of Matched Set Sizes". This is the same argument as the standard argument for `hist`
`freq`	default is TRUE. See `freq` argument in `hist` function for more.

include.empty.sets
: logical value indicating whether or not empty sets should be included in the histogram. default is FALSE. If FALSE, then empty sets will be noted as a separate vertical bar at x = 0. If TRUE, empty sets will be included as normal sets.

Examples

```
PM.results <- PanelMatch(lag = 4, time.id = "year", unit.id = "wbcode2",
                         treatment = "dem", refinement.method = "mahalanobis",
                         data = dem, match.missing = TRUE,
                         covs.formula = ~ I(lag(tradewb, 1:4)) + I(lag(y, 1:4)),
                         size.match = 5, qoi = "att",
                        outcome.var = "y", lead = 0:4, forbid.treatment.reversal = FALSE)
plot(PM.results$att)
plot(PM.results$att, include.empty.sets = TRUE)
```

---

plot.PanelEstimate *Plot point estimates and standard errors from a PanelEstimate calculation.*

Description

The plot.PanelEstimate method takes an object returned by the PanelEstimate function and plots the calculated point estimates and standard errors over the specified lead time period. The only mandatory argument is an object of the PanelEstimate class.

Usage

```
## S3 method for class 'PanelEstimate'
plot(
  x,
  ylab = "Estimated Effect of Treatment",
  xlab = "Time",
  main = "Estimated Effects of Treatment Over Time",
  ylim = NULL,
  ...
)
```

Arguments

x	a PanelEstimate object
ylab	default is "Estimated Effect of Treatment. This is the same argument as the standard argument for plot
xlab	default is "Time". This is the same argument as the standard argument for plot
main	default is "Estimated Effects of Treatment Over Time". This is the same argument as the standard argument for plot

ylim	default is NULL. This is the same argument as the standard argument for plot
...	Additional optional arguments to be passed to plot.

Examples

```
PM.results <- PanelMatch(lag = 4, time.id = "year", unit.id = "wbcode2",
                         treatment = "dem", refinement.method = "mahalanobis",
                         data = dem, match.missing = TRUE,
                         covs.formula = ~ I(lag(tradewb, 1:4)) + I(lag(y, 1:4)),
                         size.match = 5, qoi = "att",
                        outcome.var = "y", lead = 0:4, forbid.treatment.reversal = FALSE)
PE.results <- PanelEstimate(sets = PM.results, data = dem, number.iterations = 100)
plot(PE.results)
```

---

print.matched.set *Print* matched.set *objects.*

Description

Print matched.set objects.

Usage

```
## S3 method for class 'matched.set'
print(x, ..., verbose = FALSE)
```

Arguments

x	a matched.set object
...	additional arguments to be passed to print
verbose	logical indicating whether or not output should be printed in expanded/raw list form. The verbose form is not recommended unless the data set is small. Default is FALSE

Examples

```
PM.results <- PanelMatch(lag = 4, time.id = "year", unit.id = "wbcode2",
                         treatment = "dem", refinement.method = "mahalanobis",
                         data = dem, match.missing = TRUE,
                         covs.formula = ~ I(lag(tradewb, 1:4)) + I(lag(y, 1:4)),
                         size.match = 5, qoi = "att",
                        outcome.var = "y", lead = 0:4, forbid.treatment.reversal = FALSE)
print(PM.results$att)
```

summary.matched.set *Summarize information about a* matched.set *object and the matched sets contained within them.*

Description

A method for viewing summary data about the sizes of matched sets and metadata about how they were created. This method accepts all standard summary arguments.

Usage

```
## S3 method for class 'matched.set'
summary(object, ..., verbose = TRUE)
```

Arguments

object	a matched.set object
...	Optional additional arguments to be passed to the summary function
verbose	Logical value specifying whether or not a longer, more verbose summary should be calculated and returned. Default is TRUE.

Value

list object with either 5 or 1 element(s), depending on whether or not verbose is set to TRUE or not.

overview	A data.frame object containing information about the treated units (unit id, time of treatment), and the number of matched control units with weights zero and above.
set.size.summary	a summary object summarizing the minimum, maximum, and IQR of matched set sizes
number.of.treated.units	The number of unit, time pairs that are considered to be "treated" units
num.units.empty.set	The number of units treated at a particular time that were not able to be matched to any control units
lag	The size of the lag window used for matching on treatment history. This affects which treated and control units are matched.

Examples

```
PM.results <- PanelMatch(lag = 4, time.id = "year", unit.id = "wbcode2",
                         treatment = "dem", refinement.method = "mahalanobis",
                         data = dem, match.missing = TRUE,
                         covs.formula = ~ I(lag(tradewb, 1:4)) + I(lag(y, 1:4)),
                         size.match = 5, qoi = "att",
                        outcome.var = "y", lead = 0:4, forbid.treatment.reversal = FALSE)
```

```
summary(PM.results$att)
```

---

summary.PanelEstimate *Get summaries of PanelEstimate objects/calculations*

Description

summary.PanelEstimate takes an object returned by PanelEstimate, and returns a summary table of point estimates and confidence intervals

Usage

```
## S3 method for class 'PanelEstimate'
summary(object, verbose = TRUE, bias.corrected = FALSE, ...)
```

Arguments

object	A PanelEstimate object
verbose	logical indicating whether or not output should be printed in an expanded form. Default is TRUE
bias.corrected	logical indicating whether or not bias corrected estimates should be provided. Default is FALSE
...	optional additional arguments. Currently, no additional arguments are supported.

Examples

```
PM.results <- PanelMatch(lag = 4, time.id = "year", unit.id = "wbcode2",
                         treatment = "dem", refinement.method = "none",
                         data = dem, match.missing = TRUE,
                         covs.formula = ~ I(lag(tradewb, 1:4)) + I(lag(y, 1:4)),
                         size.match = 5, qoi = "att",
                        outcome.var = "y", lead = 0:4, forbid.treatment.reversal = FALSE)
PE.results <- PanelEstimate(sets = PM.results, data = dem, number.iterations = 100)
summary(PE.results)
```
